Braces, brackets, and parentheses

BASIC

The following terminology is used in American English (British English may be different.)

{ }	**Braces ("curly braces")** Braces are used to group statements and declarations. The contents of a class or interface are enclosed in braces. Method bodies and constructor bodies are enclosed in braces. Braces are used to group the statements in an `if` statement, a loop, or other control structures.
[ ]	**Brackets ("square brackets")** Brackets are used to index into an array.
( )	**Parentheses** Parentheses are used for two purposes: (1) to control the order of operations in an expression, and (2) to supply parameters to a constructor or method.
