DataTables

function column().search(input[, regex[, smart[, caseInsen]]])

```
function column.search( input [, regex[, smart[, caseInsen]]] )
function column.search( input )
function column.search( input, regex )
function column.search( input, regex, smart )
function column.search( input, regex, smart, caseInsen )
```

Description:

function column.search(input, regex)

Set the search term for the column from the selector. Note this doesn't actually perform the search, but rather queues it up - use draw() to perform the search and display the result.

```
selector , , draw() ,
```

```
regex regular expression) regex , default false (regex, regular expression) (true) (default, false) (Treat as a regular expression (true) or not (default, false). )
```

rmrScript.js

```
1 else if(column.index() == 2) {
2
       var select = $('<select style="margin-left: 0.5em; display: inline-</pre>
block; width: auto; border: 1px solid #aaa; border-radius: 3px; padding:
5px; background-color: transparent; outline-offset: -2px;"><option value="">
         </option></select>')
3
           .appendTo(selectbox)
4
           .on( 'change', function() {
5
               var text = $(this).find('option:selected').text();
6
               var val = $.fn.dataTable.util.escapeRegex($(this).val());
7
               if(text != '
                                   '&& jQuery.isEmptyObject(val)) val = '
               column.search( val ? '^' + val + '$' : '', true, false )
8
9
               .draw();
```

8

```
8 column.search( val ? '^' + val + '$' : '', true, false )
```

```
val ? '^' + val + '$' : input , regex
```
