Definition and Usage (w3schools)

each() .
Tip: return false .

## Syntax

```
$(selector).each(function(index, element))
```

.each(function)

jQuery , .

function
Type: Function (Integer index, Element element)

The .each() method is designed to make DOM looping constructs concise and less error-prone.
When called it iterates over the DOM elements that are part of the jQuery object.
Each time the callback runs, it is passed the current loop iteration, beginning from 0.
More importantly, the callback is fired in the context of the current DOM element,
so the keyword this refers to the element.

.each() DOM .
jQuery DOM .
0 .
DOM ,
this .
