spring-boot-web-application-in-eclipse-itself|How to run Spring Boot web application in Eclipse itself?]]

2. pom.xml Error : Plugin execution not covered by lifecycle configuration

```
In Eclipse Luna 4.4.0, you can chose to ignore this error in preferences
```

Window > Preferences > Maven > Errors/Warnings > Plugin execution not covered by lifecycle configuration. Select Ignore / Warning / Error as you wish. Also, in the quick fix (Ctrl + 1) for this error, it gives an option to mark goal as ignored in Eclipse build in Eclipse preferences (experimental) This is a cleaner way, as it doesn't modify your pom.xml. You will need to do a Maven > Update project to fix the same error in any other project as well.

How to solve "Plugin execution not covered by lifecycle configuration" for Spring Data Maven Builds
