# Troubleshooting

## 1. Run As Spring Boot App

```
Steps: 1. go to Run->Run configuration -> Maven Build -> New configuration
Steps: 2. set base directory of you project ie.${workspace_loc}/${
  }}
Steps: 3. set goal spring-boot:run
Steps: 4. Run project from Run->${ }
```

### How to run Spring Boot web application in Eclipse itself?

## 2. pom.xml Error : Plugin execution not covered by lifecycle configuration

In Eclipse Luna 4.4.0, you can chose to ignore this error in preferences

Window > Preferences > Maven > Errors/Warnings > Plugin execution not covered by lifecycle configuration. Select Ignore / Warning / Error as you wish. Also, in the quick fix (Ctrl + 1) for this error, it gives an option to mark goal as ignored in Eclipse build in Eclipse preferences (experimental) This is a cleaner way, as it doesn't modify your pom.xml. You will need to do a Maven > Update project to fix the same error in any other project as well.

## 3.failed to lazily initialize a collection of role or could not initialize proxy - no Session repo @Transactional . Tip:JPA . failed to lazily initialize a collection of role JPA

### How to solve "Plugin execution not covered by lifecycle configuration" for Spring Data Maven Builds , SpringBoot, Boot
